JARVIS Architecture

1. Core System

Apps: Desktop HUD, CLI, TUI
Core Packages: plugin_sdk, agent_runtime, llm_client, gateway_protocol, config_core, memory_host_sdk, channe

2. Extension Layer

Extensions provide channels, providers, media, memory, tools, productivity, voice, and infrastructure capabilities.
Each extension follows strict SDK and plugin-boundary rules.

3. Skills Layer

Skills are declarative markdown files under skills/. They describe intent, usage, and invocation patterns.

4. Memory and State

State and memory use canonical storage patterns, with SQLite preferred for runtime state and persistence.

5. Runtime Workflow

User request -> app/channel -> gateway/runtime -> model/provider -> tools/plugins -> state/memory -> response

6. Design Principles

Core stays plugin-agnostic.
Extensions communicate through jarvis_sdk.* and public contracts.
Doctor and migration flows handle config/state upgrades.
Lean architecture: no silent compatibility shims or fallback sprawl.
